

Abstract of the Invention

A mouthpiece, barrel and reed table is provided as having at least one opening for supporting at least one mouthpiece, an extension for supporting at least one barrel section, and an optional table for supporting at least one reed in an organized manner. Variations including the use of a varying plurality of openings and extensions, with or without the optional reed table, to provide the user a variety of numbers of structures which can serve to fit in a variety of different sized available spaces. The basic member is a mouthpiece and barrel support structure, typically a volume of material, preferably a stylish stained hardwood, having at least one bore for supporting a mouthpiece and at least one barrel extension member for supporting a barrel. In the embodiment shown, the volume of material supports barrel and mouthpieces in a vertical position, but strict verticality is not necessary, and it may be that the position of support may vary along with the position of the external surface of the volume of material or structure upon which the mouthpiece and barrels will depend. The reed tray is angled with respect to the upper surface of the reed tray to permit reeds to be handled easily.
